

most asked Intune interview questions with answers:

◆ General & Architecture

Q1. What are the different Intune enrollment methods?

Answer:

- **Windows:** Autopilot, Group Policy, Co-management (SCCM + Intune), Manual enrollment, Bulk enrollment (provisioning packages).
- **iOS/iPadOS:** Apple DEP (ABM/ASM), Company Portal app, Apple Configurator.
- **Android:** Android Enterprise (Work Profile, Fully Managed, Dedicated, Corporate-Owned with Work Profile), Knox Mobile Enrollment.
- **macOS:** Apple DEP, Company Portal, Apple Configurator.

👉 **L3 Tip:** Interviewers may ask which method is best for corporate vs BYOD. Answer: *Use automated enrollment for corporate (Autopilot, DEP, Knox), and portal-based for BYOD.*

Q2. How does Intune architecture integrate with Azure AD?

Answer:

- Intune relies on **Azure AD for identity and authentication.**
- Devices join via **Azure AD join / Hybrid Azure AD join / Register.**
- Conditional Access policies require Azure AD + Intune compliance signals.
- Device compliance status is sent to Azure AD for access decisions.

👉 **L3 Angle:** Emphasize integration with **AAD Conditional Access, Defender for Endpoint, SCCM (co-management).**

◆ Device & Policy Management

Q3. Difference between Device Configuration Profile and Compliance Policy?

Answer:

- **Configuration Profile:** Defines settings pushed to devices (Wi-Fi, certificates, BitLocker, restrictions, etc.).
- **Compliance Policy:** Defines rules for compliance (PIN required, encryption enabled, OS version).

- **Integration:** Compliance policies feed into Conditional Access.

👉 **L3 Tip:** If a compliance policy and configuration profile overlap, configuration enforces, while compliance only evaluates/report.

Q4. What happens if multiple configuration profiles target the same setting?

Answer:

- **Conflict:** If conflicting values → last writer wins (depends on CSP, platform).
 - **Merge:** If complementary (like different Wi-Fi profiles) → both apply.
 - **Resolution:** View in **Intune Troubleshooting Blade** → **Device configuration** → **Conflicts**.
-

Q5. How do you handle BitLocker deployment in Intune?

Answer:

- Use Endpoint Security → Disk Encryption policy.
 - Configure silent encryption + key escrow to Azure AD.
 - Troubleshooting: Check logs at
 - **MDM Diagnostic Logs:** C:\Users\Public\Documents\MDMDiagnostics
 - ****Event Viewer** → Microsoft-Windows-BitLocker\Operational`.
-

◆ Application Deployment

Q6. Types of apps Intune supports?

Answer:

- Store apps (Microsoft Store, Apple App Store, Google Play).
- Line-of-business (MSI, MSIX, APK, IPA).
- Win32 apps (packaged via IntuneWin).
- Web apps (pinned shortcuts).
- Office 365 apps.

👉 **L3 Angle:** Expect a question about **Win32 packaging**. You should explain IntuneWinAppUtil.exe → wrap → upload → detection rules → requirements.

Q7. Win32 App fails to install – what do you check?

Answer:

- **Intune Management Extension logs:**
 - C:\ProgramData\Microsoft\IntuneManagementExtension\Logs\IntuneManagementExtension.log
 - Check detection rules (common cause of “Failed” but app is installed).
 - Verify dependency apps.
 - Check exit codes in log.
-

◆ Troubleshooting

Q8. How do you troubleshoot when a device is not receiving Intune policies?

Answer:

- Confirm device shows **Enrolled & Compliant** in Intune portal.
 - Check **Sync status** (manual sync from Company Portal / Settings).
 - Review logs:
 - **Windows:** C:\Windows\CCM\Logs\DeviceManagement-Enterprise-Diagnostics-Provider
 - **MDM Diagnostics tool:** mdmdiagnosticstool.exe -area DeviceManagementEnterprise -cab c:\temp\mdm.cab
 - Check GPO conflicts if Hybrid.
 - Verify user/device in correct **Intune scope & assignments**.
-

Q9. What is Autopilot troubleshooting approach?

Answer:

- Collect logs: Shift + F10 → %windir%\Panther\UnattendGC\setupact.log
- Event Viewer → **User Device Registration, DeviceManagement-Enterprise-Diagnostics-Provider**.
- Check device hash uploaded to Intune.

- Ensure profile assigned before OOB.
-

Q10. Explain Conditional Access + Intune integration.

Answer:

- Compliance policies feed compliance status → Azure AD Conditional Access.
 - If device **non-compliant**, access is blocked.
 - Example: Require compliant device + MFA for Office 365.
 - Logs: **Azure AD Sign-in logs** + Intune compliance blade.
-

◆ Advanced / L3-Level Scenarios

Q11. How do you troubleshoot Hybrid Azure AD Join with Intune enrollment?

Answer:

- Check **DSREGCMD /status** on client.
 - Verify SCP (Service Connection Point) in AD.
 - Logs:
 - C:\Windows\System32\winevt\Logs\Microsoft-Windows-User Device Registration\Admin.evtx
 - Ensure device can reach Azure endpoints.
-

Q12. Explain CMG vs Intune in Modern Management.

Answer:

- **CMG (Cloud Management Gateway)**: SCCM extension for internet clients.
 - **Intune**: Pure MDM, cloud-native.
 - Co-management allows workloads (e.g., Compliance, Endpoint Protection, Resource Access) to be shifted from SCCM → Intune gradually.
-

Q13. How do you secure company data on personal BYOD devices in Intune?

Answer:

- Use **App Protection Policies (MAM)** → control copy/paste, save-as, encryption.
 - Conditional Access → require compliant device or App protection.
 - Wipe only company data via **Selective Wipe**, not full device reset.
-

Q14. Logs to check when MDM enrollment fails on Windows?

Answer:

- Event Viewer → **DeviceManagement-Enterprise-Diagnostics-Provider**.
 - %ProgramData%\Microsoft\MDMDiagnostics folder.
 - C:\Windows\CCM\Logs\Autopilot (for autopilot).
 - dsregcmd /status for AAD join state.
-

Q15. Common issues during iOS/Android enrollment?

Answer:

- iOS: Apple MDM Push cert expired, device not in DEP, user using personal Apple ID instead of ABM.
 - Android: Work profile blocked, Google Play sync issues, Samsung Knox misconfigured.
 - Fix: Re-issue token (Apple/Google), resync MDM authority, reset device.
-

Pro Tip for L3 interviews:

Expect **scenario-based troubleshooting** (e.g., “Users complain their apps are not installing on Windows devices enrolled via Autopilot – walk me through your troubleshooting.”). You should cover:

1. Verify assignment → check logs → confirm dependencies/detection → cross-check compliance.
 2. Mention **log file paths** (very important at L3).
 3. Mention **integration with Defender, SCCM, Conditional Access**.
-

Q16. How do you troubleshoot when Intune Compliance Policy is not applied?

Answer:

- Confirm user/device is in the right assignment group.
 - Check policy status in **Intune Troubleshooting blade**.
 - Logs: DeviceManagement-Enterprise-Diagnostics-Provider in Event Viewer.
 - Ensure device synced → trigger via Company Portal / Settings.
 - Check for duplicate compliance settings with **GPO or SCCM Baselines**.
-

Q17. What's the difference between Required, Available, and Uninstall app assignments in Intune?

Answer:

- **Required:** Installs automatically.
- **Available:** User installs from Company Portal.
- **Uninstall:** Removes the app if present.

👉 L3 twist: Interviewers may ask how this behaves in **Win32 apps** → Detection rules must be correct, else uninstall may not trigger.

Q18. What are Enrollment Restrictions in Intune?

Answer:

- Restrict devices by **OS type, version, device ownership (Corporate vs Personal)**.
 - Can block BYOD devices, enforce minimum OS.
 - Controlled in **Device Enrollment → Enrollment restrictions**.
-

Q19. How do you troubleshoot Win32 app stuck at "Pending Install"?

Answer:

- Verify device has **Intune Management Extension** installed.
- Logs: IntuneManagementExtension.log.
- Check detection rules.
- Verify device has internet access to Intune CDN endpoints.
- Force sync → restart IME service.

Q20. What are the Intune MDM Authority options?

Answer:

- Intune (standalone cloud).
- SCCM (hybrid – deprecated).
- Co-management with SCCM + Intune.

👉 Modern deployments use **cloud-only Intune** or **co-management**.

Q21. What's the difference between App Protection Policies (MAM) and Device Compliance Policies (MDM)?

Answer:

- **MAM (App Protection Policy):** Protects data inside managed apps, works on BYOD without device enrollment.
 - **MDM (Device Compliance Policy):** Ensures device-level compliance (PIN, encryption, OS version).
-

Q22. How do you configure Office 365 app deployment via Intune?

Answer:

- Endpoint Manager → Apps → Office 365 Suite → Configure (Excel, Word, Teams, OneDrive).
 - Supports both 32-bit and 64-bit.
 - Customization available: update channel, languages.
 - Logs: C:\Windows\CCM\Logs\IntuneManagementExtension.log.
-

Q23. How do you collect logs remotely from Intune-managed devices?

Answer:

- Use **Collect diagnostics** from the device blade in Intune.
- This collects event logs, registry, IME logs, policy diagnostics.
- Downloadable from the Intune portal.

Q24. Explain the difference between Autopilot Reset, Fresh Start, and Wipe.

Answer:

- **Wipe:** Factory reset, removes user data + apps.
- **Autopilot Reset:** Resets device but maintains enrollment and Intune settings.
- **Fresh Start:** Reinstalls Windows, removes preinstalled OEM bloatware, keeps MDM enrollment.

Q25. How do you integrate Intune with Microsoft Defender for Endpoint (MDE)?

Answer:

- Enable MDE integration in Endpoint Security → MDE connector.
- Compliance policies can use **device risk score** from Defender.
- Devices with high risk → blocked via Conditional Access.
- Logs: Defender portal + Intune compliance dashboard.

Q26. What's the difference between Compliance Policy "Mark device non-compliant" vs Conditional Access block?

Answer:

- **Non-compliant policy:** Flags device as non-compliant but does not block access.
- **Conditional Access:** Uses compliance status to enforce block/quarantine.
👉 Both must work together.

Q27. How do you troubleshoot Company Portal app not working on iOS/Android?

Answer:

- Check **App Protection Policy** assignments.
 - Verify MDM push certificate (iOS) or Managed Google Play sync (Android).
 - Reinstall Company Portal.
 - Logs: Use iOS Console logs (Xcode), Android → logcat.
-

Q28. Explain Intune RBAC (Role-Based Access Control).

Answer:

- Provides granular roles (Helpdesk, Policy Admin, App Admin).
 - Assignable by **scope tags** for multi-tenant or department segregation.
 - Example: Helpdesk can only wipe/reset devices, not create policies.
-

Q29. What's the difference between App Wrapping Tool and IntuneWin packaging?

Answer:

- **App Wrapping Tool:** Used for iOS/Android apps to apply MAM policies.
 - **IntuneWin Packaging:** Used for Win32 apps (wraps EXE/MSI → uploads to Intune).
-

Q30. How do you configure and troubleshoot VPN/Wi-Fi profiles in Intune?

Answer:

- Use **Device Configuration profiles** → VPN/Wi-Fi templates.
 - Certificates usually required → Deploy via **SCEP or PKCS profile**.
 - Logs: DeviceManagement-Enterprise-Diagnostics-Provider.
 - Common issue: **cert not deployed** → VPN fails.
-

Q31. Explain the difference between Managed Devices and Managed Apps.

Answer:

- **Managed Device:** Full device enrolled, policies applied at OS level.
 - **Managed App:** Only corporate apps protected, device remains unmanaged (BYOD scenarios).
-

Q32. How do you handle Patch Management in Intune?

Answer:

- Use **Windows Update for Business (WUfB)** profiles → Configure deferral, deadlines.
- Use **Feature Update policies** to lock specific Windows versions.

- Reporting available in **Update Compliance logs**.
-

Q33. How do you troubleshoot Autopilot when device is not picking up assigned profile?

Answer:

- Verify hardware hash uploaded and assigned.
 - Ensure profile assigned before OOB.
 - Check device is in correct group (Dynamic group membership).
 - Logs: C:\Windows\Panther\UnattendGC\setupact.log, Event Viewer.
-

Q34. Explain the Intune lifecycle of a device (Corporate-owned Windows).

Answer:

1. Purchase → upload hardware hash.
 2. Assign Autopilot profile.
 3. OOB → AAD Join + Enrollment.
 4. Intune policies applied.
 5. Apps deployed.
 6. Compliance checked → Conditional Access enforcement.
 7. Retirement/Wipe when user leaves.
-

Q35. How do you manage certificates with Intune?

Answer:

- Integrate with NDES/SCEP or PKCS.
 - Deploy Root/Intermediate CA via **Trusted certificate profile**.
 - Deploy client certificates via SCEP/PKCS profiles.
 - Used for VPN/Wi-Fi/Email encryption.
 - Troubleshooting: Check **NDES connector logs**, Event Viewer on CA server.
-

Perfect 👍 At **L3 level**, most interviewers love to throw **scenario-based Intune questions** instead of theory, because they test how you think under real-world troubleshooting. Here's a list of **Scenario-based Intune Interview Q&A (L3)**:

◆ Intune Scenario-Based Questions & Answers

Q1. Users report that required Win32 applications are not installing after Autopilot enrollment. How would you troubleshoot?

Answer:

1. Verify **Autopilot profile assignment** and device in correct group.
 2. Check if **Intune Management Extension (IME)** is installed on the client.
 - Logs:
C:\ProgramData\Microsoft\IntuneManagementExtension\Logs\IntuneManagementExtension.log.
 3. Confirm **Detection rules** for Win32 apps are correct.
 4. Check **Exit codes** in IME logs.
 5. Trigger **manual sync** or restart IME service.
 6. Cross-check Conditional Access is not blocking app installation.
-

Q2. A user's device shows "Not Compliant" but policies look applied. What do you do?

Answer:

- Open device in Intune portal → check which compliance rule failed.
 - Run `dsregcmd /status` to confirm Azure AD join.
 - Logs: Event Viewer → DeviceManagement-Enterprise-Diagnostics-Provider.
 - Confirm **encryption/PIN/OS version** is as per compliance policy.
 - Resync device → if still failing, collect logs with **MDMDiagnosticsTool**.
-

Q3. A BYOD user says Outlook mobile is asking for a PIN even though the device already has one.

Answer:

- This is due to **App Protection Policy (MAM)** → it enforces its own PIN separate from device PIN.
 - Check **App Protection Policy settings** (PIN required, biometric allowed).
 - If company policy → explain to user; otherwise modify MAM settings.
-

Q4. Autopilot enrollment is failing with “Something went wrong” after device reset. What do you check?

Answer:

- Verify **device hash uploaded** to Intune & profile assigned.
 - Ensure device is in correct **Dynamic AAD group**.
 - Logs:
 - %windir%\Panther\UnattendGC\setupact.log
 - Event Viewer → **User Device Registration** logs.
 - Check network → device must reach MS endpoints.
 - Confirm Autopilot profile synced before OOB.
-

Q5. A user is unable to access Teams on mobile; CA policy requires compliant device. Device shows compliant in Intune but blocked in Azure AD.

Answer:

- Check **Azure AD Sign-in logs** → see Conditional Access evaluation.
 - Delay possible: Compliance signals from Intune → AAD can take **~30 mins**.
 - Force device sync from Company Portal.
 - If persistent → verify compliance policies (encryption, PIN, OS version).
-

Q6. User’s device is enrolled, but Wi-Fi/VPN profiles are not applying.

Answer:

- Check assignment of Configuration Profile.
- Logs: DeviceManagement-Enterprise-Diagnostics-Provider.
- If cert-based VPN → verify certificate profile delivered.

- Check if user/device is in correct scope group.
 - Ensure VPN/Wi-Fi CSP is supported on device OS.
-

Q7. Your organization wants to allow BYOD users to access Outlook/Teams, but no corporate data should remain if they leave. How would you configure?

Answer:

- Deploy **App Protection Policies (MAM)** → restrict copy/paste, save-as.
 - Conditional Access → require App Protection Policy for Office apps.
 - Configure **Selective Wipe** → removes only corporate data, keeps personal apps/files.
-

Q8. Users complain Autopilot reset does not remove all apps. Why?

Answer:

- **Autopilot Reset** only restores to a clean corporate state but keeps Intune enrollment & policies.
 - It will **reinstall corporate apps**, not wipe completely.
 - To fully wipe → use **Wipe** action instead.
-

Q9. Intune administrator mistakenly deleted the Apple Push Notification (APNS) certificate. What happens and how do you fix it?

Answer:

- iOS/iPadOS devices will lose connectivity with Intune.
 - You must **re-create the same APNS cert** with same Apple ID → re-upload in Intune.
 - If Apple ID changed, all devices must be **re-enrolled**.
-

Q10. Android devices are not getting Company Portal enrollment option. What could be wrong?

Answer:

- Verify **Android Enterprise enrollment token** is set up.
- Check if **Managed Google Play** is connected in Intune.

- Ensure device supports Android Work Profile.
 - If Samsung → confirm Knox Mobile Enrollment configured.
-

Q11. User's device is compliant, but encryption still shows "Not applicable" in compliance policy.

Answer:

- Likely device does not support BitLocker/FileVault.
 - Check OS edition (Windows Home doesn't support BitLocker).
 - Ensure TPM is enabled.
 - For macOS → FileVault must be enabled manually or via configuration profile.
-

Q12. You deployed an MSI app but it fails, while manual installation works. What's your next step?

Answer:

- Wrap MSI with **IntuneWinAppUtil.exe** instead of deploying raw MSI.
 - Define **detection rules** properly (Registry/File/Version check).
 - Check app exit code in IME logs.
 - Ensure dependencies are installed first.
-

Q13. Users are reporting "Your device is already being managed" when enrolling. What do you do?

Answer:

- Check if device is already enrolled under a different user.
 - Remove from Intune → delete record.
 - Check for SCCM/Co-management overlap.
 - Logs: `dsregcmd /status`.
 - Re-enroll with correct account.
-

Q14. A VIP executive complains his Outlook data remains after he left the company. How do you fix this?

Answer:

- Run **Selective Wipe** from Intune (removes corporate data only).
- Ensure **App Protection Policy** is applied to enforce wipe on sign-out.
- If device fully corporate-owned → use **Wipe device** instead.

Q15. Windows 10 feature updates are not applying, even though WUfB is configured.

Answer:

- Check if **Feature Update Policy** is assigned to device.
- Ensure device connected to Windows Update service (not WSUS if Hybrid).
- Logs: C:\Windows\SoftwareDistribution\ReportingEvents.log.
- Check update rings and deadlines.

◆ **Intune Troubleshooting Matrix (L3 Level)**

Scenario	Where to Check (Logs/Portal)	Fix / Troubleshooting Steps	Preventive Steps
1. Win32 app not installing	- IME logs: C:\ProgramData\Microsoft\IntuneManagementExtension\Logs\IntuneManagementExtension.log - Intune portal → Device → Managed Apps	- Verify app assignment (Required vs Available) - Check detection rules - Confirm dependencies - Retry sync / restart IME service	- Standardize detection rules - Test apps on pilot devices before production rollout
2. Device shows “Not Compliant”	- Intune portal → Device compliance blade - Event Viewer: DeviceManagement-Enterprise-Diagnostics-Provider	- Identify failed rule (encryption, OS version, PIN) - Force sync - Run dsregcmd /status	- Regular compliance reporting - Communicate minimum OS & security baselines
3. Autopilot	- %windir%\Panther\UnattendG	- Verify device hash uploaded & assigned profile	- Maintain Autopilot device import

Scenario	Where to Check (Logs/Portal)	Fix / Troubleshooting Steps	Preventive Steps
enrollment fails	C:\setupact.log - Event Viewer → User Device Registration	- Check AAD group membership - Ensure internet/MS endpoints accessible	process - Validate profile assignment before rollout
4. Wi-Fi/VPN profile not applying	- Intune portal → Device config status - Event Viewer: DeviceManagement-Enterprise-Diagnostics-Provider	- Check certificate deployment - Verify CSP supported on OS - Ensure device/user in scope group	- Always deploy Root CA first - Test VPN/Wi-Fi config on pilot batch
5. Outlook mobile asking for extra PIN	- Intune → App Protection Policies	- Modify MAM settings (allow biometric, reuse device PIN)	- Communicate difference between device PIN vs app PIN
6. Conditional Access blocking Teams/Outlook	- Azure AD Sign-in logs - Intune compliance status	- Force device sync - Verify compliance policies - Adjust CA rules	- Define CA baseline with exceptions for testing - Educate users on compliance enforcement
7. Company Portal not working on iOS/Android	- iOS: Console logs (Xcode) - Android: logcat	- Check MDM push cert (iOS) / Managed Google Play sync (Android) - Reinstall Company Portal	- Renew APNS cert yearly - Verify Android Enterprise token regularly
8. User sees "Device already"	- dsregcmd /status - Intune portal → Devices	- Remove old enrollment record - Reset device - Re-enroll	- Document re-enrollment steps - Automate device retirement for leavers

Scenario	Where to Check (Logs/Portal)	Fix / Troubleshooting Steps	Preventive Steps
managed " error			
9. APNS certificat e expired	- Endpoint Manager → Tenant admin → Apple MDM Push cert	- Renew with same Apple ID - If changed → re-enroll all iOS devices	- Maintain APNS renewal calendar reminders
10. BitLocker policy not applying	- Event Viewer: Microsoft-Windows-BitLocker/Operational - MDM diagnostics tool	- Confirm TPM enabled - Verify OS edition supports BitLocker - Check Endpoint Security → Disk Encryption policy	- Use security baselines - Test encryption silently before mass rollout
11. Selective Wipe didn't remove Outlook data	- Intune portal → Device actions history	- Ensure App Protection Policies applied - Retry Selective Wipe - Force logout from apps	- Enforce MAM policies for BYOD users
12. Feature Updates not installing	- Logs: C:\Windows\SoftwareDistribution\ReportingEvents.log - Update Compliance portal	- Check WUfB rings - Verify Feature Update policy assigned - Ensure device not bound to WSUS	- Pilot feature updates before production - Keep WUfB documentation
13. Dynamic group not applying Autopilot profile	- Azure AD → Dynamic groups membership	- Verify group rule syntax - Ensure device uploaded hash includes serial - Run group membership recalculation	- Standardize group rules - Validate dynamic group with test devices
14. Android enrollme nt blocked	- Intune → Device enrollment → Enrollment restrictions	- Check enrollment restrictions - Ensure Android Enterprise token valid - Enable Work Profile on device	- Review enrollment restriction policy quarterly

Scenario	Where to Check (Logs/Portal)	Fix / Troubleshooting Steps	Preventive Steps
15. Certificate-based VPN not working	- NDES/SCEP connector logs - Event Viewer on CA server	- Verify SCEP connector running - Ensure Root CA deployed - Redeploy client cert	- Monitor NDES services - Implement certificate auto- renew alerts
